

ABSTRACT OF THE DISCLOSURE

A heat dissipating device includes a heat receiving unit having a heat receiving surface thermally connected to a heat generating object and
5 a heat dissipating surface in an opposite to the receiving surface, a heat transferring unit mounted on the dissipating surface, transferring the heat received in the heat receiving surface, and diffusing the transferred heat to the dissipating surface, and a heat
10 dissipating unit mounted on the dissipating surface and dissipating the diffused heat. An electronic apparatus includes a circuit board having an electronic part generating heat, a main body installing the circuit board, and the heat dissipating device described above.
